1. INTRODUCTION With the introduction of fuzzy sets by Prof. Zadeh [8] and intuitionistic fuzzy sets by Atanassov [5], the graph structure was discussed by Sampathkumar [2]. Dinesh and Ramakrishnan [17] contributed fuzzy graph structure. The notion of intuitionistic fuzzy graph structure (IFGS) $\tilde{G}=$ $\left(A, B_{1}, B_{2}, \ldots, B_{k}\right)$ are defined and introduced by the author in [6] ,[7] and [13]. In this paper, Max- Min Matrix of intuitionistic fuzzy graph structure is discussed. Then the coefficients of the characteristic polynomial of $\mathrm{M}(\tilde{G})$ are also defined and explained.
2. II PRELIMINARIES

Some definitions and results that are necessary in this paper are reviewed,

Definition (2.1) [11]: A graph $G$ is a pair of set (V, E), denoted by $G=(\mathrm{V}, \mathrm{E})$, where V is a set of vertices and $E$ is a set of edges. Each edge in $E$ is a pair of vertices in V. Each edge is associated with a set consisting of either one or two vertices called its endpoints.
Definition (2.2) [11]: An edge whose endpoints are the same is called a loop.
Definition (2.3) [11]: A graph without loops and parallel edges is called a simple graph.

Definition (2.4) [2]: $G=\left(V, R_{1}, R_{2}, \ldots, R_{k}\right)$ is a graph structure if V is a non empty set and $R_{1}, R_{2}, \ldots, R_{k}$ are relations on $V$ which are mutually disjoint such that each $R_{i}, i=1,2,3, \ldots, k$, is symmetric and irreflexive.

Definition (2.5) [6]: Let $G=\left(V, R_{1}, R_{2}, \ldots, R_{k}\right)$ be a graph structure and let $A$ be an intuitionistic fuzzy subset (IFS) on $V$ and $B_{1}, B_{2}, \ldots, B_{k}$ are intuitionistic fuzzy relations (IFR) on V which are mutually disjoint, symmetric and irreflexive such that

$$
\mu_{B_{i}}(u, v) \leq \mu_{\mathrm{A}}(u) \wedge \mu_{\mathrm{A}}(v) \text { and } v_{B_{i}}(u, v) \leq v_{A}(u) \vee v_{\mathrm{A}}(v) \quad \forall u, v \in \mathrm{~V} \text { and } i=1,2, \ldots, \mathrm{k} .
$$

Then $\widetilde{G}=\left(\mathrm{A}, \mathrm{B}_{1}, \mathrm{~B}_{2}, \ldots, \mathrm{~B}_{\mathrm{k}}\right)$ is an intuitionistic fuzzy graph structure (IFGS) of G .

## III. MAX - MIN MATRIX OF AN INTUITIONISTIC FUZZY GRAPH STRUCTURE

Definition (3.1): Let $\widetilde{G}=\left(\mathrm{A}, \mathrm{B}_{1}, \mathrm{~B}_{2}, \ldots, \mathrm{~B}_{\mathrm{k}}\right)$ be an intuitionistic fuzzy graph structure (IFGS) of G for each vertex $i$. Define $\alpha_{p}(j)$ and $\beta_{p}(j)$ as follows

$$
\begin{aligned}
& \alpha_{p}(j)=\max \left\{\mu_{B_{p}}(i j), \forall i\right\}, p=1,2, \ldots, k . \\
& \alpha_{1}(j)=\max \left\{\mu_{B_{1}}(1 j), \mu_{B_{1}}(2 j), \mu_{B_{1}}(3 j), \ldots \ldots ., \mu_{B_{1}}(\mathrm{k} j)\right\}, \\
& \alpha_{2}(j)=\max \left\{\mu_{B_{2}}(1 j), \mu_{B_{2}}(2 j), \mu_{B_{2}}(3 j), \ldots \ldots \ldots, \mu_{B_{2}}(\mathrm{k} j)\right\}, \\
& \alpha_{3}(j)=\max \left\{\mu_{B_{3}}(1 j), \mu_{B_{3}}(2 j), \mu_{B_{3}}(3 j), \ldots \ldots \ldots, \mu_{B_{3}}(\mathrm{k} j)\right\},
\end{aligned}
$$

$$
\alpha_{k}(j)=\max \left\{\mu_{B_{k}}(1 j), \mu_{B_{k}}(2 j), \mu_{B_{k}}(3 j), \ldots \ldots \ldots, \mu_{B_{k}}(\mathrm{k} j)\right\}
$$

and similarly,

$$
\begin{aligned}
& \beta_{p}(j)=\min \left\{v_{B_{p}}(i j), \forall i\right\}, p=1,2, \ldots, k . \\
& \beta_{1}(j)=\min \left\{v_{B_{1}}(1 j), v_{B_{1}}(2 j), v_{B_{1}}(3 j), \ldots \ldots, v_{B_{1}}(\mathrm{k} j)\right\}, \\
& \beta_{2}(j)=\min \left\{v_{B_{2}}(1 j), v_{B_{2}}(2 j), v_{B_{2}}(3 j), \ldots \ldots ., v_{B_{2}}(\mathrm{k} j)\right\}, \\
& \beta_{3}(j)=\min \left\{v_{B_{3}}(1 j), v_{B_{3}}(2 j), v_{B_{3}}(3 j), \ldots \ldots ., v_{B_{3}}(\mathrm{k} j)\right\},
\end{aligned}
$$

And

$$
\beta_{k}(j)=\min \left\{v_{B_{k}}(1 j), v_{B_{k}}(2 j), v_{B_{k}}(3 j), \ldots \ldots \ldots, v_{B_{k}}(\mathrm{k} j)\right\}
$$

where $\mu_{B_{p}}(i j)$ represents the strength of relationship between $\mathrm{u}_{\mathrm{i}}$ and $\mathrm{u}_{\mathrm{j}}$ and $\nu_{B_{p}}(i j)$ represents the strength of non-relationship between $u_{i}$ and $u_{j}$.

Remark (3.2): For convenience, here some notations are used.
$\mu_{B_{p}}\left(u_{i}, u_{j}\right)$ is denoted by $\mu_{B_{p}}(i j)$ and $v_{B_{p}}\left(u_{i}, u_{j}\right)$ by $v_{B_{p}}(i j), \quad \forall p=1,2, \ldots, k$.
Definition (3.3): Let $\tilde{G}=\left(\mathrm{A}_{1}, \mathrm{~B}_{1}, \mathrm{~B}_{2}, \ldots, \mathrm{~B}_{\mathrm{k}}\right)$ be given IFGS of $G$. Two vertices $\mathrm{u}_{\mathrm{i}}$ and $\mathrm{u}_{\mathrm{j}}$ are mutually adjacent if there is an edge between $u_{i}$ and $u_{j}$ i.e. there is an edge from $u_{i}$ to $u_{j}$ and there is an edge from $u_{j}$ to $u_{i}$.
Definition (3.4): Let $\tilde{G}=\left(\mathrm{A}, \mathrm{B}_{1}, \mathrm{~B}_{2}, \ldots, \mathrm{~B}_{\mathrm{k}}\right)$ be an IFGS of G . Three vertices $\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}$ and $\mathrm{u}_{\mathrm{p}}$ are said to be cyclic if there is an edge from $u_{i}$ to $u_{j}$, from $u_{j}$ to $u_{p}$ and from $u_{p}$ to $u_{i}$.

Definition (3.5): Let $\tilde{G}=\left(\mathrm{A}, \mathrm{B}_{1}, \mathrm{~B}_{2}, \ldots, \mathrm{~B}_{\mathrm{k}}\right)$ be an IFGS of G . The $\mathrm{B}_{\mathrm{p}}$-Max-Min Matrix Of IFGS $\tilde{G}$ is defined as $\mathrm{M}_{\mathrm{p}}(\tilde{G})=\left[\left(\mathrm{t}_{\mathrm{pij}}, \mathrm{m}_{\mathrm{pij}}\right)\right]$, where $\mathrm{t}_{\mathrm{pij}}=0, \mathrm{~m}_{\mathrm{pij}}=0 \forall \mathrm{i}=\mathrm{j}$ and for $\mathrm{i} \neq \mathrm{j}$, $\mathrm{t}_{\mathrm{pj}}=\left\{\begin{array}{ccc}\max \left(\alpha_{p}(i), \alpha_{p}(j)\right) & \text { if } & \mu_{B_{p}}(i j) \neq 0, \forall \mathrm{p} \\ 0 & \text { if } & \mu_{B_{p}}(i j)=0, \forall \mathrm{p}\end{array}\right\}$ and $m_{\mathrm{pjj}}=\left\{\begin{array}{lll}\min \left(\beta_{p}(i), \beta_{p}(j)\right) & \text { if } & v_{B_{p}}(i j) \neq 0, \forall \mathrm{p} \\ 0 & \text { if } & v_{B_{p}}(i j)=0, \forall \mathrm{p}\end{array}\right\}$

Definition (3.6): Let $\tilde{G}=\left(\mathrm{A}_{,} \mathrm{B}_{1}, \mathrm{~B}_{2}, \ldots, \mathrm{~B}_{\mathrm{k}}\right)$ be an IFGS of G . The Max-Min Matrix Of $\tilde{G}$ is defined as $\mathrm{M}(\tilde{G})=\left[\left(\max \left(\mathrm{t}_{\mathrm{pij}}\right), \min \left(\mathrm{m}_{\mathrm{pij}}\right)\right)\right]=\left[\left(\mathrm{t}_{\mathrm{ij}}, \mathrm{m}_{\mathrm{ij}}\right)\right]$.

Definition (3.7): Max-Min Matrix Of $\tilde{G}$ consists of two different matrices one containing the entries as membership values and the other containing the entries as non-membership values as $\mathrm{M}(\tilde{G})=\left[\left(\max \left(\mathrm{t}_{\mathrm{pij}}\right), \min \left(\mathrm{m}_{\mathrm{pij}}\right)\right)\right]=\left[\left(\mathrm{t}_{\mathrm{ij}}, \mathrm{m}_{\mathrm{ij}}\right)\right]$ where the matrix containing the entries as membership values are termed as Max degree matrix of intuitionistic fuzzy graph structure and is denoted by $\mathrm{T}=\left[\mathrm{t}_{\mathrm{ij}}\right]$ and the matrix containing the entries as nonmembership values are termed as Min degree matrix of intuitionistic fuzzy graph structure and is denoted by $\mathrm{N}=\left[\mathrm{m}_{\mathrm{ij}}\right]$.

Example (3.8): Take example of link structure of a website and represent it by directed IFGS. The links are considered as vertices and the path between the links are considered as edges. The strength of each edge is taken as the membership value and the non- strength as non-membership value. Suppose an IFGS $\tilde{G}=\left(\mathrm{A}, \mathrm{B}_{1}, \mathrm{~B}_{2}\right)$ as displayed in the following diagram.

$\mathrm{M}(\widetilde{G})=\left[\left(\mathrm{t}_{\mathrm{ij}}, \mathrm{m}_{\mathrm{ij}}\right)\right]$,
$\therefore \mathrm{M}(\tilde{G})=\left[\begin{array}{cccc}(0,0) & \left(\mathrm{t}_{12}, \mathrm{~m}_{12}\right) & \left(\mathrm{t}_{13}, \mathrm{~m}_{13}\right) & \left(\mathrm{t}_{14}, \mathrm{~m}_{14}\right) \\ \left(\mathrm{t}_{21}, \mathrm{~m}_{21}\right) & (0,0) & \left(\mathrm{t}_{23}, \mathrm{~m}_{23}\right) & \left(\mathrm{t}_{24}, \mathrm{~m}_{24}\right) \\ \left(\mathrm{t}_{31}, \mathrm{~m}_{31}\right) & \left(\mathrm{t}_{32}, \mathrm{~m}_{32}\right) & (0,0) & \left(\mathrm{t}_{34}, \mathrm{~m}_{34}\right) \\ \left(\mathrm{t}_{41}, \mathrm{~m}_{41}\right) & \left(\mathrm{t}_{42}, \mathrm{~m}_{42}\right) & \left(\mathrm{t}_{43}, \mathrm{~m}_{43}\right) & (0,0)\end{array}\right] \quad$ where
$T=\left[\begin{array}{cccc}0 & \mathrm{t}_{12} & \mathrm{t}_{13} & \mathrm{t}_{14} \\ \mathrm{t}_{21} & 0 & \mathrm{t}_{23} & \mathrm{t}_{24} \\ \mathrm{t}_{31} & \mathrm{t}_{32} & 0 & \mathrm{t}_{34} \\ \mathrm{t}_{41} & \mathrm{t}_{42} & \mathrm{t}_{43} & 0\end{array}\right] \quad$ and $\quad \mathrm{N}=\left[\begin{array}{cccc}0 & m_{12} & m_{13} & m_{14} \\ m_{21} & 0 & m_{23} & m_{24} \\ m_{31} & m_{32} & 0 & m_{34} \\ m_{41} & m_{42} & m_{43} & 0\end{array}\right]$
Here in this example, $\mathrm{M}_{1}(\tilde{G})=\left[\begin{array}{cccc}(0,0) & (0.7,0.1) & (0.5,0.1) & (0.5,0.4) \\ (0.7,0.1) & (0,0) & (0.7,0.1) & (0.7,0.1) \\ (0.5,0.2) & (0.7,0.2) & (0,0) & (0.4,0.2) \\ (0.5,0.4) & (0.7,0.1) & (0.4,0.2) & (0,0)\end{array}\right]$

$$
\text { and } \mathrm{M}_{2}(\tilde{G})=\left[\begin{array}{cccc}
(0,0) & (0.8,0.1) & (0.8,0.1) & (0.8,0.1) \\
(0.8,0.1) & (0,0) & (0.8,0.1) & (0.8,0.1) \\
(0.8,0.1) & (0.8,0.1) & (0,0) & (0.3,0.5) \\
(0.8,0.1) & (0.8,0.1) & (0.3,0.5) & (0,0)
\end{array}\right]
$$

$\therefore \mathrm{M}(\tilde{G})=\left[\begin{array}{cccc}(0,0) & (0.8,0.1) & (0.8,0.1) & (0.8,0.1) \\ (0.8,0.1) & (0,0) & (0.8,0.1) & (0.8,0.1) \\ (0.8,0.1) & (0.8,0.1) & (0,0) & (0.4,0.2) \\ (0.8,0.1) & (0.8,0.1) & (0.4,0.2) & (0,0)\end{array}\right] \quad$ where
$T=\left[\begin{array}{cccc}0 & 0.8 & 0.8 & 0.8 \\ 0.8 & 0 & 0.8 & 0.8 \\ 0.8 & 0.8 & 0 & 0.4 \\ 0.8 & 0.8 & 0.4 & 0\end{array}\right] \quad$ and $\quad N=\left[\begin{array}{cccc}0 & 0.1 & 0.1 & 0.1 \\ 0.1 & 0 & 0.1 & 0.1 \\ 0.1 & 0.1 & 0 & 0.2 \\ 0.1 & 0.1 & 0.2 & 0\end{array}\right]$

Result (3.9): Let $\mathrm{M}(\tilde{G})=\left[\left(\mathrm{t}_{\mathrm{ij}}, \mathrm{m}_{\mathrm{ij}}\right)\right]$, where $\mathrm{T}=\left[\mathrm{t}_{\mathrm{ij}}\right], \mathrm{N}=\left[\mathrm{m}_{\mathrm{ij}}\right]$. The characteristic polynomial of T and N is an equation of order n if G has n vertices.

Note (3.10): In this paper, only the polynomial of order 4 will be used.
Remark (3.11): The characteristic polynomial of $T$ of order 4 is $a_{0} \lambda^{4}-a_{1} \lambda^{3}+a_{2} \lambda^{2}-a_{3} \lambda+a_{4}=0$, where $\mathrm{a}_{0}=1, \mathrm{a}_{1}=\operatorname{tr}(\mathrm{T}), a_{2}=\frac{1}{2}\left[(\operatorname{tr}(T))^{2}-\left(\operatorname{tr}\left(T^{2}\right)\right], a_{3}=\frac{1}{6}\left[(\operatorname{tr}(T))^{3}-3\left(\operatorname{tr}\left(T^{2}\right) \operatorname{tr}(T)+2 \operatorname{tr}\left(T^{3}\right)\right], \quad \mathrm{a}_{4}=\right.\right.$ $\operatorname{det}(\mathrm{T})$.

Remark (3.12): The characteristic polynomial of matix N as $\mathrm{b}_{0} \delta^{4}-\mathrm{b}_{1} \delta^{3}+\mathrm{b}_{2} \delta^{2}-\mathrm{b}_{3} \delta+\mathrm{b}_{4}=0$ , where $\mathrm{b}_{0}=1, \mathrm{~b}_{1}=\operatorname{tr}(\mathrm{N}), b_{2}=\frac{1}{2}\left[(\operatorname{tr}(N))^{2}-\left(\operatorname{tr}\left(N^{2}\right)\right], \mathrm{b}_{3}=\frac{1}{6}\left[(\operatorname{tr}(N))^{3}-3\left(\operatorname{tr}\left(N^{2}\right) \operatorname{tr}(N)+2 \operatorname{tr}\left(N^{3}\right)\right], \mathrm{b}_{4}=\right.\right.$ $\operatorname{det}(\mathrm{N})$

Now to see the explicit expressions for the coefficients of $a_{2}, a_{3}, b_{2}$ and $b_{3}$.
Lemma (3.13): In the characteristic polynomial of $\mathrm{T}, a_{2}=-\sum_{1 \leq i<j \leq n}\left(\mathrm{t}_{\mathrm{ij}}\right)^{2}$ such that the vertices $\mathrm{u}_{\mathrm{i}}$ and $\mathrm{u}_{\mathrm{j}}$ are mutually adjacent.

Proof: Generally $a_{2}=\frac{1}{2}\left[(\operatorname{tr}(T))^{2}-\left(\operatorname{tr}\left(T^{2}\right)\right]\right.$, (from Remark (3.11),

If the vertices $u_{i}$ and $u_{j}$ are mutually adjacent, then $t_{i j}=t_{\mathrm{ji}}$ otherwise any one of $t_{i j}$ or $t_{\mathrm{ji}}$ will be zero.
$\therefore a_{2}=\sum_{1 \leq i<j \leq n}\left|\begin{array}{cc}0 & t_{i j} \\ t_{\mathrm{ij}} & 0\end{array}\right|=\left|\begin{array}{cc}0 & t_{12} \\ t_{21} & 0\end{array}\right|+\left|\begin{array}{cc}0 & t_{13} \\ t_{31} & 0\end{array}\right|+\left|\begin{array}{cc}0 & t_{14} \\ t_{41} & 0\end{array}\right|+\left|\begin{array}{cc}0 & t_{23} \\ t_{32} & 0\end{array}\right|+\left|\begin{array}{cc}0 & t_{24} \\ t_{42} & 0\end{array}\right|+\left|\begin{array}{cc}0 & t_{34} \\ t_{43} & 0\end{array}\right|$
$=-\left[\mathrm{t}_{12} \mathrm{t}_{21}+\mathrm{t}_{13} \mathrm{t}_{31}+\mathrm{t}_{14} \mathrm{t}_{41}+\mathrm{t}_{23} \mathrm{t}_{32}+\mathrm{t}_{24} \mathrm{t}_{42}+\mathrm{t}_{34} \mathrm{t}_{43}\right]$
$\therefore a_{2}=-\sum_{1 \leq i<i j \leq n}\left(\mathrm{t}_{\mathrm{i}}\right)^{2} \quad$ if the vertices $\mathrm{u}_{\mathrm{i}}$ and $\mathrm{u}_{\mathrm{j}}$ are mutually adjacent.

Cor (3.14): In the characteristic polynomial of $\mathrm{N}, b_{2}=\sum_{1 \leq i i j \leq n}\left(m_{\mathrm{ij}}\right)^{2}$ such that the vertices $\mathrm{u}_{\mathrm{i}}$ and $\mathrm{u}_{\mathrm{j}}$ are mutually adjacent.
Proof: Generally $b_{2}=\frac{1}{2}\left[(\operatorname{tr}(N))^{2}-\left(\operatorname{tr}\left(N^{2}\right)\right]\right.$,
(from Remark
(3.12),

If the vertices $u_{i}$ and $u_{j}$ are mutually adjacent, then $m_{i j}=m_{j i}$ otherwise any one of $m_{i j}$ or $\mathrm{m}_{\mathrm{ji}}$ will be zero.
$\therefore \mathrm{b}_{2}=\sum_{1 \leq i<j \leq n}\left|\begin{array}{cc}0 & m_{\mathrm{ij}} \\ m_{\mathrm{ij}} & 0\end{array}\right|=\left|\begin{array}{cc}0 & m_{12} \\ m_{21} & 0\end{array}\right|+\left|\begin{array}{cc}0 & m_{13} \\ m_{31} & 0\end{array}\right|+\left|\begin{array}{cc}0 & m_{14} \\ m_{41} & 0\end{array}\right|+\left|\begin{array}{cc}0 & m_{23} \\ m_{32} & 0\end{array}\right|+\left|\begin{array}{cc}0 & m_{24} \\ m_{42} & 0\end{array}\right|+\left|\begin{array}{cc}0 & m_{34} \\ m_{43} & 0\end{array}\right|$
$=-\left[\mathrm{m}_{12} \mathrm{~m}_{21}+\mathrm{m}_{13} \mathrm{~m}_{31}+\mathrm{m}_{14} \mathrm{~m}_{41}+\mathrm{m}_{23} \mathrm{~m}_{32}+\mathrm{m}_{24} \mathrm{~m}_{42}+\mathrm{m}_{34} \mathrm{~m}_{43}\right]$
$\therefore b_{2}=\sum_{1 \leq i<j \leq n}\left(m_{\mathrm{ij}}\right)^{2} \quad$ if the vertices $\mathrm{u}_{\mathrm{i}}$ and $\mathrm{u}_{\mathrm{j}}$ are mutually adjacent.
Lemma (3.15): In the characteristic polynomial of $T, a_{3}=\sum_{1 \leq i<j \leq i n} t_{i j} \mathrm{t}_{\mathrm{jp}} \mathrm{t}_{\mathrm{pi}} \quad$ where the summation is taken over all $\mathrm{i}, \mathrm{j}$ and p if the vertices $\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}$ and $\mathrm{u}_{\mathrm{p}}$ are cyclic in $\tilde{G}$

Proof: From Remark (3.11), $a_{3}=\frac{1}{6}\left[(\operatorname{tr}(T))^{3}-3\left(\operatorname{tr}\left(T^{2}\right) \operatorname{tr}(T)+2 \operatorname{tr}\left(T^{3}\right)\right]\right.$,
$\therefore a_{2}=\sum_{1 \leq i<j<p \leqslant n}\left|\begin{array}{lll}t_{\mathrm{ii}} & t_{\mathrm{ij}} & t_{\mathrm{ip}} \\ t_{\mathrm{ji}} & t_{\mathrm{ij}} & t_{\mathrm{jp}} \\ t_{\mathrm{pi}} & t_{\mathrm{pj}} & t_{\mathrm{pp}}\end{array}\right|$
$=-\left[\mathrm{t}_{12} \mathrm{t}_{23} \mathrm{t}_{31}+\mathrm{t}_{12} \mathrm{t}_{24} \mathrm{t}_{41}+\mathrm{t}_{13} \mathrm{t}_{34} \mathrm{t}_{41}+\mathrm{t}_{13} \mathrm{t}_{32} \mathrm{t}_{21}+\mathrm{t}_{14} \mathrm{t}_{43} \mathrm{t}_{31}+\mathrm{t}_{14} \mathrm{t}_{42} \mathrm{t}_{21}+\mathrm{t}_{23} \mathrm{t}_{34} \mathrm{t}_{42}+\mathrm{t}_{24} \mathrm{t}_{43} \mathrm{t}_{32}\right]$
-- (2)
If the vertices $\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}$ and $\mathrm{u}_{\mathrm{p}}$ are cyclic in $\tilde{G}$, then $a_{3}=\sum_{1 \leq i<j<p \leq n} \mathrm{t}_{\mathrm{ij}} \mathrm{t}_{\mathrm{p} \mathrm{p}} \mathrm{t}_{\mathrm{p}} \quad$ otherwise any one of $\mathrm{t}_{\mathrm{ij}}$ or $\mathrm{t}_{\mathrm{jp}}$ or $\mathrm{t}_{\mathrm{pi}}$ will be zero.
$\therefore$ (2) becomes $a_{3}=\sum_{1 \leq i \lll p \leq n} \mathrm{t}_{\mathrm{ij}} \mathrm{t}_{\mathrm{jp}} \mathrm{t}_{\mathrm{pi}}$ where the summation is taken over all $\mathrm{i}, \mathrm{j}$ and p if the vertices $\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}$ and $\mathrm{u}_{\mathrm{p}}$ are cyclic in $\widetilde{G}$.
Cor (3.16): In the characteristic polynomial of $\mathrm{N}, b_{3}=\sum_{1 \leq i i j \leq n} m_{\mathrm{ij}} m_{\mathrm{jp}} m_{\mathrm{pi}} \quad$ where the summation is taken over all $\mathrm{i}, \mathrm{j}$ and p if the vertices $\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}$ and $\mathrm{u}_{\mathrm{p}}$ are cyclic in $\tilde{G}$

Proof: From Remark (3.12), $\mathrm{b}_{3}=\frac{1}{6}\left[(\operatorname{tr}(N))^{3}-3\left(\operatorname{tr}\left(N^{2}\right) \operatorname{tr}(N)+2 \operatorname{tr}\left(N^{3}\right)\right]\right.$,
$\therefore \mathrm{b}_{2}=\sum_{1 \leq i \lll p \leq n}\left|\begin{array}{lll}m_{\mathrm{ii}} & m_{\mathrm{ij}} & m_{\mathrm{ip}} \\ m_{\mathrm{ji}} & m_{\mathrm{jj}} & m_{\mathrm{jp}} \\ m_{\mathrm{pi}} & m_{\mathrm{pj}} & m_{\mathrm{pp}}\end{array}\right|$
$=-\left[m_{12} m_{23} m_{31}+m_{12} m_{24} m_{41}+m_{13} m_{34} m_{41}+m_{13} m_{32} m_{21}+m_{14} m_{43} m_{31}+m_{14} m_{42} m_{21}+m_{23}\right.$
$\left.\mathrm{m}_{34} \mathrm{~m}_{42}+\mathrm{m}_{24} \mathrm{~m}_{43} \mathrm{~m}_{32}\right] \quad$--- (2)
If the vertices $\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}$ and $\mathrm{u}_{\mathrm{p}}$ are cyclic in $\tilde{G}$, then $b_{3}=\sum_{1 \leq i<j \leq \leq n} m_{\mathrm{ij}} m_{\mathrm{jp}} m_{\mathrm{pi}} \quad$ otherwise any one of $\mathrm{m}_{\mathrm{ij}}$ or $\mathrm{m}_{\mathrm{jp}}$ or $\mathrm{m}_{\mathrm{pi}}$ will be zero.
$\therefore$ (2) becomes $b_{3}=\sum_{1 \leq i j i \leq \leq n} m_{\mathrm{ij}} m_{\mathrm{jp}} m_{\mathrm{pi}} \quad$ where the summation is taken over all $\mathrm{i}, \mathrm{j}$ and p if the vertices $\mathrm{u}_{\mathrm{i}}, \mathrm{u}_{\mathrm{j}}$ and $\mathrm{u}_{\mathrm{p}}$ are cyclic in $\tilde{G}$.

## IV. CONCLUSION

In the present paper, the max-min matrix of intuitionistic fuzzy graph structure is introduced. It can be further used in the development of new concepts related to Max- min matrix of intuitionistic fuzzy graph structure.
