## 1. Introduction

Today, in the information age, the need to protect communications from prying eyes is greater than ever before [5].Cryptography, the science of encryption and it plays a central role in many aspects of our daily lives like security of ATM cards, computer passwords, sending emails, e-commerce. Conventional Encryption is called symmetric encryption or single key encryption. It may be similarly divided into classes of classical techniques and modern strategies. The hallmark of traditional encryption is that the cipher or key to the set of rules is shared, i.e., regarded with the aid of the parties involved inside the secured communication exchange. Substitution cipher is one of the simple components of classical ciphers. A substitution cipher is a technique of encryption by way of which devices of plaintext are substituted with cipher text according to a regular system; the units may be single letters (the most common), pairs of letters, triplets of letters, combinations of the above, and so on. The receiver deciphers the text by using appearing an inverse substitution [3]. The units of the plaintext are retained within the identical sequence as inside the cipher text, but the devices themselves are altered. There are some of special sorts of substitution cipher. If the cipher operates on single letters, it's miles termed easy substitution cipher; a cipher that operates on large organizations of letters is named polygraphic. A monoalphabetic cipher uses constant substitution over the whole message, whereas a polyalphabetic cipher makes use of a number of substitutions at one-of-a-kind instances in the message- along with homophones, where a unit from the plaintext is mapped to considered one of several possibilities inside the cipher text. The inverse of the matrix used for encrypting the plaintext does not constantly exist. So, if the matrix is not invertible, the encrypted text can't be decrypted. In the self-invertible matrix generation method, the matrix used for the encryption is itself self-invertible. So, at the time of decryption, we want now not to find inverse of the matrix. Moreover, this technique gets rid of the computational complexity concerned in finding inverse of the matrix at the same time as decryption. BibhudendraAcharya in [5] ,generated SelfInvertible Matrix and used in Hill cipher.In this paper we discuss about cryptanalysis of Affine Hill cipher and Digraph Affine Hill cipher using Self-Invertible Matrix algorithm.

## 2. Preliminaries:

2.1.Self-Invertible Matrix: A square matrix A is said to be Self-Invertible MatrixifA ${ }^{-1}=A$.

### 2.2.The Affine Hill cipher:

The Affine Hill cipher extends the concept of Hill cipher by mixing it with a nonlinear affine transformation [2]. The Affine Hill cipher is an application linear algebra. It is one the block cipher to encrypt and decrypt the messages using matrix key and its inverse and it is a symmetric key algorithm. So the encryption expression will have the form of $\mathrm{Q}=(\mathrm{KP}+\mathrm{R})(\bmod m)$. All operations are performed over $Z_{m}$. Where $R$ is column vector over $Z_{m}$. It should satisfy $\operatorname{gcd}(\operatorname{det} K(\bmod m), m)=1$ and P is the plain text, Q is the cipher text.

## Encryption:

$\left.\mathrm{Q}=\left(\begin{array}{cccc}\mathrm{k}_{11} & \mathrm{k}_{12} & \cdots & \mathrm{k}_{1 \mathrm{n}} \\ \mathrm{k}_{21} & \mathrm{k}_{22} & \cdots & \mathrm{k}_{2 \mathrm{n}} \\ \cdots & \cdots & \cdots & \cdots \\ \mathrm{k}_{\mathrm{n} 1} & \mathrm{k}_{\mathrm{n} 2} & \cdots & \mathrm{k}_{\mathrm{nn}}\end{array}\right) \mathrm{P}+\mathrm{R}\right)(\bmod \mathrm{m})$

Decryption:
$\mathrm{P}=\left(\begin{array}{cccc}\mathrm{k}_{11} & \mathrm{k}_{12} & \cdots & \mathrm{k}_{1 \mathrm{n}} \\ \mathrm{k}_{21} & \mathrm{k}_{22} & \cdots & \mathrm{k}_{2 \mathrm{n}} \\ \cdots & \cdots & \cdots & \cdots \\ \mathrm{k}_{\mathrm{n} 1} & \mathrm{k}_{\mathrm{n} 2} & \cdots & \mathrm{k}_{\mathrm{nn}}\end{array}\right)^{-1} \quad(\mathrm{Q}-\mathrm{R})(\bmod m)$

## 3. A General method of generating an even orderself-invertible matrix under modulation of a prime number:

Let $K=\left(\begin{array}{cccc}\mathrm{k}_{11} & \mathrm{k}_{12} & \cdots & \mathrm{k}_{1 \mathrm{n}} \\ \mathrm{k}_{21} & \mathrm{k}_{22} & \cdots & \mathrm{k}_{2 \mathrm{n}} \\ \mathrm{k}_{\mathrm{n} 1} & \mathrm{k}_{\mathrm{n} 2} & \cdots & \mathrm{k}_{\mathrm{nn}}\end{array}\right)$ be a matrix of order n and p be a prime number.
Then $\mathrm{K}=\left(\begin{array}{cccc}\mathrm{k}_{11} & \mathrm{k}_{12} & \cdots & \mathrm{k}_{1 \mathrm{n}} \\ \mathrm{k}_{21} & \mathrm{k}_{22} & \cdots & \mathrm{k}_{2 \mathrm{n}} \\ \cdots & \cdots & \cdots & \cdots \\ \mathrm{k}_{\mathrm{n} 1} & \mathrm{k}_{\mathrm{n} 2} & \cdots & \mathrm{k}_{\mathrm{nn}}\end{array}\right)$ be an $n \times n$ self - invertible matrix partitioned into
$\mathrm{K}=\left(\begin{array}{ll}\mathrm{K}_{11} & \mathrm{~K}_{12} \\ \mathrm{~K}_{21} & \mathrm{~K}_{22}\end{array}\right)$ where n is even and $\mathrm{K}_{11}, \mathrm{~K}_{12}, \mathrm{~K}_{21}$ and $\mathrm{K}_{22}$ are matrices of order $\frac{n}{2} \times \frac{n}{2}$ each.
Construction of an even self - invertible matrix

- Select any arbitrary $\frac{n}{2} \times \frac{n}{2}$ matrix $\mathrm{K}_{22}$
- Obtain $\mathrm{K}_{11}=-\mathrm{K}_{22}(\bmod \mathrm{p})$
- If take $\mathrm{K}_{12}=\mathrm{c}\left(\mathrm{I}-\mathrm{K}_{11}\right)(\bmod \mathrm{p})$ then $\mathrm{K}_{21}=\frac{\left(\mathrm{I}+\mathrm{K}_{11}\right)}{c}(\bmod \mathrm{p})$ where c is a scalar constant and I is the identity matrix.
- Form the matrix completely

### 3.1.Example:

Let $\mathrm{p}=37$, let $\mathrm{n}=2$, let $\mathrm{K}_{22}=4$, let $\mathrm{c}=2$
$\mathrm{K}_{11}=-\mathrm{K}_{22}(\bmod \mathrm{p}) \Rightarrow \mathrm{K}_{11}=-4(\bmod 37) \Rightarrow \mathrm{K}_{11}=33$
$\mathrm{K}_{12}=2\left(\mathrm{I}-\mathrm{K}_{11}\right)(\bmod \mathrm{p}) \Rightarrow \mathrm{K}_{12}=2(1-33)(\bmod 37) \Rightarrow \mathrm{K}_{12}=10$
$\mathrm{K}_{21}=\frac{\left(\mathrm{I}+\mathrm{K}_{11}\right)}{c}(\bmod \mathrm{p}) \Rightarrow \mathrm{K}_{21}=\frac{(1+33)}{2}(\bmod 37) \Rightarrow \mathrm{K}_{21}=17(\bmod 37)$
There fore $K=\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)(\bmod 37)$ is an even order self-invertible matrix.

### 3.2.Example:

Let $\mathrm{p}=37$, let $\mathrm{n}=2$, let $\mathrm{K}_{22}=4$, let $\mathrm{c}=1$
$\mathrm{K}_{11}=-\mathrm{K}_{22}\left(\bmod \mathrm{p}^{2}\right) \Rightarrow \mathrm{K}_{11}=-4\left(\bmod 37^{2}\right) \Rightarrow \mathrm{K}_{11}=1365$
$\mathrm{K}_{12}=\left(\mathrm{I}-\mathrm{K}_{11}\right)\left(\bmod \mathrm{p}^{2}\right) \Rightarrow \mathrm{K}_{12}=(1-1365)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{K}_{12}=5$
$\mathrm{K}_{21}=\frac{\left(\mathrm{I}+\mathrm{K}_{11}\right)}{c}\left(\bmod \mathrm{p}^{2}\right) \Rightarrow \mathrm{K}_{21}=(1+1365)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{K}_{21}=1366\left(\bmod 37^{2}\right)$
There fore $K=\left(\begin{array}{ll}1365 & 5 \\ 1366 & 4\end{array}\right)\left(\bmod 37^{2}\right)$ is an even order self-invertible matrix.

### 3.3.Example:

Let $\mathrm{p}=37$, let $\mathrm{n}=4$, let $\mathrm{K}_{22}=\left(\begin{array}{cc}10 & 2 \\ 3 & 4\end{array}\right)$, let $\mathrm{c}=1$
$K_{11}=-K_{22}(\bmod p) \Rightarrow K_{11}=-\left(\begin{array}{cc}10 & 2 \\ 3 & 4\end{array}\right)(\bmod 37) \Rightarrow K_{11}=\left(\begin{array}{cc}27 & 35 \\ 34 & 33\end{array}\right)(\bmod 37)$
$\mathrm{K}_{12}=\mathrm{c}\left(\mathrm{I}-\mathrm{K}_{11}\right)(\bmod \mathrm{p}) \Rightarrow \mathrm{K}_{12}=\left(\mathrm{I}-\mathrm{K}_{11}\right)(\bmod 37) \Rightarrow \mathrm{K}_{12}=\left(\left(\begin{array}{ll}1 & 0 \\ 0 & 1\end{array}\right)-\right.$
$\left.\left(\begin{array}{ll}27 & 35 \\ 34 & 33\end{array}\right)\right)(\bmod 37)=\left(\begin{array}{cc}11 & 2 \\ 3 & 5\end{array}\right)$
$\mathrm{K}_{21}=\frac{\left(\mathrm{I}+\mathrm{K}_{11}\right)}{c}(\bmod \mathrm{p}) \Rightarrow \mathrm{K}_{21}=\left(\begin{array}{ll}28 & 35 \\ 34 & 34\end{array}\right)$
There fore $K=\left(\begin{array}{cccc}27 & 35 & 11 & 2 \\ 34 & 33 & 3 & 5 \\ 28 & 35 & 10 & 2 \\ 34 & 34 & 3 & 4\end{array}\right)(\bmod 37)$ is an even order self-invertible matrix.

## 4.An even order self-invertible matrix on Affine Hill Cipher:

Prime modulus generates large key space than a composite modulus and taking q is prime number. The plaintext column vector $\mathbf{P i s}$ encrypted as $\mathbf{Q}=(\mathbf{K P}+\mathbf{R})(\bmod q)$ in which $\mathbf{Q}$ is the cipher text column vector, $\mathbf{K}$ is an even order $m \times m$ key matrix in $\mathrm{Z}_{q}$ and The cipher text $\mathbf{Q}$ is decrypted as
$\mathbf{P}=\mathbf{K}(\mathbf{Q}-\mathbf{R})(\bmod q)$ where $\mathrm{R}=\mathbf{K}_{i}(1 \leq i \leq \mathrm{m})$ is one of the column vector K over $\mathrm{Z}_{q}$ andIt should satisfy g.c.d $(\operatorname{det} \mathbf{K}(\bmod q), q)=$ 1.If the length of the plain text is odd then add space letter to given plain text so that the length of the plain text is even.

### 4.1. Encryption algorithm

- Step1: Generate even order self -invertible matrix key $\mathbf{K}$.
- Step2: Calculate $\mathbf{Q}=(\mathbf{K P}+\mathbf{R})(\bmod q)$
- Step3: Write Cipher text

### 4.2. Decryption algorithm:

- Step1:In put Keys $\mathbf{K}, \mathbf{R}$
- Step2: Calculate $\mathbf{P}=\mathbf{K}(\mathbf{Q}-\mathbf{R})(\bmod q)$
- Step3:Write Plain text

### 4.3.An example of even order self-invertible matrix on Affine Hill Cipher:

In the 37-letter alphabet in which A-Z have numerical equivalent 0-25,0-9 have numerical equivalent 2635 ,space $=36$. And q=37.
Now consider plain text "YK17"
$\mathrm{P}=\left(\begin{array}{c}Y \\ K \\ 1 \\ 17\end{array}\right)$ is block of plain text. $\mathrm{P}=\left(\begin{array}{l}24 \\ 10 \\ 27 \\ 33\end{array}\right)$ is block of plain text.
Taking keys from example 3.2 , we get $\mathrm{K}=\left(\begin{array}{cccc}27 & 35 & 11 & 2 \\ 34 & 33 & 3 & 5 \\ 28 & 35 & 10 & 2 \\ 34 & 34 & 3 & 4\end{array}\right)$ and $\mathrm{R}=\left(\begin{array}{l}27 \\ 34 \\ 28 \\ 34\end{array}\right)$
Encryption:
$\mathbf{Q}=(\mathbf{K P}+\mathbf{R})(\bmod 37)$
$\mathrm{Q}=\left(\left(\begin{array}{cccc}27 & 35 & 11 & 2 \\ 34 & 33 & 3 & 5 \\ 28 & 35 & 10 & 2 \\ 34 & 34 & 3 & 4\end{array}\right)\left(\begin{array}{l}24 \\ 10 \\ 27 \\ 33\end{array}\right)+\left(\begin{array}{l}27 \\ 34 \\ 28 \\ 34\end{array}\right)\right)(\bmod 37)$
$\mathrm{Q}=\left(\begin{array}{l}19 \\ 20 \\ 17 \\ 34\end{array}\right)(\bmod 37)$
Cipher text="TUR8"

Decryption: $\mathbf{P}=\mathbf{K}(\mathbf{Q}-\mathbf{R})(\bmod 37)$
$\mathrm{R}=\left(\begin{array}{cccc}27 & 35 & 11 & 2 \\ 34 & 33 & 3 & 5 \\ 28 & 35 & 10 & 2 \\ 34 & 34 & 3 & 4\end{array}\right)\left(\begin{array}{l}19 \\ 20 \\ 17 \\ 34\end{array}\right)(\bmod 37)=\left(\begin{array}{l}24 \\ 10 \\ 27 \\ 33\end{array}\right)$
Which gives original plain text is "YK17"
Now consider another plain text "YEAR2017"
$\mathrm{P}=\left(\begin{array}{llll}Y & A & 2 & 1 \\ E & R & 0 & 7\end{array}\right)$ is block of plain text. $\mathrm{P}=\left(\begin{array}{llll}24 & 0 & 28 & 27 \\ 4 & 17 & 26 & 33\end{array}\right)$ is block of plain text.
Taking keys from example 3.1, we getK $=\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right), R=\binom{10}{4}$
Encryption: $\mathbf{Q}=(\mathbf{K P} \mathbf{+} \mathbf{R})(\bmod 37)$
$\mathbf{Q}_{\mathbf{1}}=\left(\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{24}{4}+\binom{10}{4}\right)(\bmod 37)=\binom{28}{21}$
$\mathbf{Q}_{2}=\left(\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{0}{17}+\binom{10}{4}\right)(\bmod 37)=\binom{32}{35}$
$\mathbf{Q}_{\mathbf{3}}=\left(\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{28}{26}+\binom{10}{4}\right)(\bmod 37)=\binom{10}{29}$
$\mathbf{Q}_{4}=\left(\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{27}{33}+\binom{10}{4}\right)(\bmod 37)=\binom{10}{3}$
Cipher text $\mathrm{Q}=\left(\mathbf{Q}_{\mathbf{2}}, \mathbf{Q}_{\mathbf{2}}, \mathbf{Q}_{\mathbf{3}}, \mathbf{Q}_{4}\right)=$ " 2 V 69 K 3 KD "
Decryption: $\mathbf{P}=\mathbf{K}(\mathbf{Q}-\mathbf{R})(\bmod 37)$
$\mathbf{P}_{\mathbf{1}}=\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{28}{21}(\bmod 37)=\binom{24}{4}$
$\mathbf{P}_{\mathbf{2}}=\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{22}{31}(\bmod 37)=\binom{0}{17}$
$\mathbf{P}_{\mathbf{3}}=\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{0}{25}(\bmod 37)=\binom{28}{26}$
$\mathbf{P}_{4}=\left(\begin{array}{cc}33 & 10 \\ 17 & 4\end{array}\right)\binom{0}{36}(\bmod 37)=\binom{27}{33}$
This gives original plain text $\mathrm{P}=\left(\mathbf{P}_{\mathbf{1}}, \mathbf{P}_{\mathbf{2}}, \mathbf{P}_{\mathbf{3}}, \mathbf{P}_{\mathbf{4}}\right)=$ "YEAR2017"

## 5. Cryptanalysis of known plaintext attack when $m$ is known on Affine Hill cipher:

The Affine Hill Cipher, the opponent has to know the values of the size m of the plaintext block size $n$ of the cipher text block and the constant vector $b$ to determine the matrix of the transformation even for a known plaintext attack. Let us assume that the opponent has determined the value of the $m$ being used. Let $m$ be distinct plaintext-cipher text pairs, say, $\boldsymbol{x j}=\left(x_{1 j}, \quad x_{2 j}, \quad \ldots, x_{m j}\right) \quad$ and $\quad \boldsymbol{y} j=\left(y_{1 j}, \quad y_{2 j}, \quad \ldots, \quad y_{m j}\right), \quad 1 \leq j \leq m, \quad$ such that $\boldsymbol{y}_{\mathrm{j}}=e k\left(\boldsymbol{x}_{j}\right)+\mathrm{b}$,Define $m \times m$ matrices $\boldsymbol{P}=\left(x_{i j}\right)$ and $\boldsymbol{Q}=\left(y_{i j}\right)$. Whenever $\boldsymbol{K}$ is invertible in the encryption equation $\boldsymbol{Q}=\boldsymbol{K} \boldsymbol{P}+\boldsymbol{R}$, one has to choose a differentcontinuous pair of plaintextcipher text pairs.

### 5.1. Algorithm for known plain-text attack when $m$ is known

Step1: Let $\mathrm{P}=\left(\mathrm{P}_{1}, \mathrm{P}_{2}, \ldots \ldots, \mathrm{P}_{\mathrm{n}}\right)$ be a block of plain text. Where $\mathrm{P}_{\mathrm{i}}=\left(\begin{array}{c}p_{1 i} \\ p_{2 i} \\ \vdots \\ p_{m i}\end{array}\right)$.

Let $\mathrm{Q}=\left(\mathrm{C}_{1}, \mathrm{C}_{2}, \ldots \ldots, \mathrm{C}_{\mathrm{n}}\right)$ be ablock of cipher text. Where $\mathrm{C}_{\mathrm{i}}=\left(\begin{array}{c}c_{1 i} \\ c_{2 i} \\ \vdots \\ c_{m i}\end{array}\right)$
Select continuous pairs of plaintext andtheir corresponding cipher text are $\left(\mathrm{P}_{\mathrm{i}}, \mathrm{C}_{\mathrm{i}}\right)$ for $i=1,2,3 \ldots \ldots . n$.
Step2: The known plaintext - cipher text pairs gives us a system of equations of the form
$\left[C_{i}-C_{j}\right]=K\left[P_{i}-P_{j}\right]$ for $1 \leq i \neq j \leq m$, we get general equation $C=K P$
Step 3: Determine $\mathrm{K}=\mathrm{P}^{-1} \mathrm{C}(\bmod \mathrm{q})$
Step 4:Determine R, substitute $\mathrm{K}, \mathrm{P}, \mathrm{C}$ in $\mathrm{C}=(\mathrm{KP}+\mathrm{R})(\bmod q)$

### 5.2. Example for cryptanalysis when $\mathbf{m}=\mathbf{2}$ is known

Taking from Example 4.3, we get plaintext blocks are $\mathrm{P}_{1}=\binom{24}{4}, \mathrm{P}_{2}=\binom{0}{17}, \mathrm{P}_{3}=\binom{28}{26}$, corresponding cipher text blocks are $\mathrm{C}_{1}=\binom{28}{21}, \mathrm{C}_{2}=\binom{32}{35}, \mathrm{C}_{3}=\binom{10}{29}$
then $\left(C_{1}-C_{2} \quad C_{2}-C_{3}\right)=\mathrm{K}\left(P_{1}-P_{2} \quad P_{2}-P_{3}\right)$

$$
\begin{aligned}
& \left(\begin{array}{cc}
33 & 22 \\
23 & 6
\end{array}\right)=K\left(\begin{array}{cc}
24 & 9 \\
24 & 28
\end{array}\right) \Rightarrow K=\left(\begin{array}{cc}
33 & 22 \\
23 & 6
\end{array}\right)\left(\begin{array}{cc}
24 & 9 \\
24 & 28
\end{array}\right)^{-1}=\left(\begin{array}{cc}
33 & 10 \\
17 & 4
\end{array}\right) \\
& \mathrm{Q}=(\mathrm{KP}+\mathrm{R}) \Rightarrow \mathrm{R}=\mathrm{Q}-\mathrm{KP}=\binom{28}{21}-\binom{18}{17}=\binom{10}{4}
\end{aligned}
$$

To overcome this we make use of Digraph Affine Hill Cipher

## 6. Digraph Affine Hill Cipher:

The Digraph Affine Hill cipher is an application linear algebra. It is one the block cipher to encrypt and decrypt the messages using matrix key and its inverse and it is a symmetric key algorithm. The plaintext column vector $\mathbf{P i s}$ encrypted as $\mathbf{Q}=(\mathbf{P K}+\mathbf{R})\left(\bmod q^{2}\right)$ in which $\mathbf{Q}$ is the cipher text column vector, $\mathbf{K}$ is an $m \times m$ key matrix in $Z_{q^{2}}$ and The cipher text $\mathbf{Q}$ is decrypted as $\mathbf{P}=(\mathbf{Q}-\mathbf{R}) \boldsymbol{K}^{\mathbf{1}}(\bmod$ $q^{2}$ ) where $\mathrm{R}=\mathbf{K}_{i}(1 \leq i \leq \mathrm{m})$ is one of the column vector K over $Z_{q^{2}}$ andIt should satisfy g.c.d $(\operatorname{det} \mathbf{K}(\bmod q), q)=1$. Where q is prime number .Let n be an even length plaintext. If n is not even length of plain text add space letter then $n+1$ will be even.Letplain text $\mathbf{P}=\left(\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{P}_{3}, \ldots \ldots \mathrm{P}_{n / 2}\right)$ andcipher text $\mathbf{Q}=\left(Q_{1}, Q_{2}, Q_{3}, \ldots \ldots Q_{n / 2}\right)$. In Digraph Affine cipher, plaintext and cipher text messages are 2-letter blocks, called digraphs. i.e plaintext is combined into 2 -letter segments. If the entire plaintext has odd number of letters, then in order to obtain a whole number of digraphs add an extra letter(space) at the end.
$\left.\mathrm{P}_{\frac{i}{2}+1}=\left(\mathrm{x}_{i+1} q+\mathrm{x}_{i+2}\right)\right)\left(\bmod q^{2}\right)$
(1)
where $\mathrm{i}=0,2,4,6 \ldots \ldots . . \mathrm{n}-2, x_{i}$ is the numerical equivalent of the $\mathrm{i}^{\text {th }}$ letter of plaintext in the digraph Cipher text is split into 2 -letter segments.
$\mathrm{Q}_{\frac{i}{2}+1}=\left(\mathrm{y}_{i+1} q+\mathrm{y}_{i+2}\right)\left(\bmod q^{2}\right)$
(2)
where $\mathrm{i}=0,2,4,6 \ldots \ldots . . . n-2, y_{i}$ is the numerical equivalent of the $i^{\text {th }}$ letter of cipher text in the digraph. In decryption process cipher text is combined into 2-letter segments using (2),after decryption plaintext is split into 2 -letter segments using (1)

## Encryption:

combined into $2-$ letter segmentsP $\left.{ }_{\frac{i}{2}+1}=\left(\mathrm{x}_{i+1} q+\mathrm{x}_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . . \mathrm{n}-2$
$Q_{j}=\left(\mathrm{P}_{j}\left(\begin{array}{cccc}\mathrm{k}_{11} & \mathrm{k}_{12} & \cdots & \mathrm{k}_{1 \mathrm{n}} \\ \mathrm{k}_{21} & \mathrm{k}_{22} & \cdots & \mathrm{k}_{2 \mathrm{n}} \\ \cdots & \cdots & \cdots & \cdots \\ \mathrm{k}_{\mathrm{n} 1} & \mathrm{k}_{\mathrm{n} 2} & \cdots & \mathrm{k}_{\mathrm{nn}}\end{array}\right)+\mathrm{R}\right)\left(\bmod q^{2}\right)$ where $\quad \mathrm{j}=1,2, \ldots \frac{n}{2}$
split into 2-letter segments $\left.\mathrm{Q}_{\frac{i}{2}+1}=\left(\mathrm{y}_{i+1} q+\mathrm{y}_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . . . \mathrm{n}-2$

## Decryption:

combine into 2 - letter segments $\left.Q_{\frac{i}{2}+1}=\left(y_{i+1} q+y_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . . n-2$
$\mathrm{P}_{j}=\left(Q_{j}-\mathrm{R}\right)\left(\begin{array}{cccc}\mathrm{k}_{11} & \mathrm{k}_{12} & \cdots & \mathrm{k}_{1 \mathrm{n}} \\ \mathrm{k}_{21} & \mathrm{k}_{22} & \cdots & \mathrm{k}_{2 \mathrm{n}} \\ \cdots & \cdots & \cdots & \cdots \\ \mathrm{k}_{\mathrm{n} 1} & \mathrm{k}_{\mathrm{n} 2} & \cdots & \mathrm{k}_{\mathrm{nn}}\end{array}\right)^{-1} \quad\left(\bmod q^{2}\right) \quad$ where $\quad \mathrm{j}=1,2, \ldots \frac{n}{2}$
split into 2-letter segments $\left.\mathrm{P}_{\frac{i}{2}+1}=\left(\mathrm{x}_{i+1} q+\mathrm{x}_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . \mathrm{n}-2$

## 7.An even order self-invertible matrix on Digraph Affine Hill Cipher:

The plaintext column vector $\mathbf{P i s}$ encrypted as $\left.\mathbf{Q}=(\mathbf{K P}+\mathbf{R})\left(\bmod q^{2}\right)\right)$ in which $\mathbf{Q}$ is the cipher text column vector, $\mathbf{K}$ is an even order $m \times m$ key matrix in $Z q^{2}$ ) and The cipher text $\mathbf{Q}$ is decrypted as
$\left.\mathbf{P}=\mathbf{K}(\mathbf{Q}-\mathbf{R})\left(\bmod q^{2}\right)\right)$ where $\mathrm{R}=\mathbf{K}_{i}(1 \leq i \leq \mathrm{m})$ is one of the row vector K over $\left.\mathrm{Zq}{ }^{2}\right)$ andIt should satisfy g.c.d $(\operatorname{det} \mathbf{K}(\bmod q), q)=1$.Let plain text $\mathbf{P}=\left(\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{P}_{3}, \ldots \ldots \mathrm{P}_{n / 2}\right)$ andcipher text $\mathbf{Q}=\left(Q_{1}, Q_{2}, Q_{3}, \cdots \cdots Q_{n / 2}\right)$.

## Encryption:

Theplaintext is combining into 2-letter segments iecombine into $2-$ letter segments ${\underset{i}{i}+1}=\left(\mathrm{x}_{i+1} q+\mathrm{x}_{i+2}\right))\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . \mathrm{n}-2$
$Q=(\mathrm{P} K+\mathrm{R})\left(\bmod q^{2}\right)$
split into 2-letter segments $Q_{\frac{i}{2}+1}=\left(y_{i+1} q+\mathrm{y}_{i+2}\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . . \mathrm{n}-2$
It can be written as $\mathrm{Q}_{\frac{i}{2}+1}=\left(\mathrm{y}_{i+1}, \mathrm{y}_{i+2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . \mathrm{n}-2$

## Decryption:

combine into 2 - letter segments $\left.Q_{\frac{i}{2}+1}=\left(y_{i+1} q+y_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $i=0,2,4,6 \ldots \ldots . . n-2$
$P=(Q-\mathrm{R}) K\left(\bmod q^{2}\right)$
split into 2-letter segments $\left.\mathrm{P}_{\frac{i}{2}+1}=\left(\mathrm{x}_{i+1} q+\mathrm{x}_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots \ldots \mathrm{n}-2$
It can be written as $\mathrm{P}_{\frac{i}{2}+1}=\left(\mathrm{x}_{i+1}, \mathrm{x}_{i+2}\right)$ where $\mathrm{i}=0,2,4,6 \ldots \ldots . \mathrm{n}-2$.

### 7.1.An example of even order self-invertible matrix on Digraph Affine Hill Cipher:

In the 37-letter alphabet in which A-Z have numerical equivalent 0-25,0-9 have numerical equivalent 2635 ,space $=36$. And q=37.
Plain text=YEAR2017, Length of the plain text $\mathrm{n}=8, \mathrm{P}=\left(\mathrm{P}_{1}, \mathrm{P}_{2}, \mathrm{P}_{3}, \mathrm{P}_{4}\right)$ where $\mathrm{P}_{1}=(24,4)$, $\mathrm{P}_{2}=(0,17), \mathrm{P}_{3}=(28,26), \mathrm{P}_{4}=(27,33)$
Taking keys from example 3.2, we getK $=\left(\begin{array}{ll}1365 & 5 \\ 1366 & 4\end{array}\right), \mathrm{R}=\left(\begin{array}{ll}1365 & 5\end{array}\right)$

## Encryption:

combine into $2-$ letter segments $\left.\mathrm{P}_{\frac{i}{2}+1}=\left(\mathrm{x}_{i+1} q+\mathrm{x}_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6$
For $\left.\left.\mathrm{i}=0, \mathrm{P}_{1}=\left(37 \mathrm{x}_{1}+\mathrm{x}_{2}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{P}_{1}=((24)(37)+4)\right)\left(\bmod 37^{2}\right)=892\left(\bmod 37^{2}\right)$
For $\left.\left.\mathrm{i}=2, \mathrm{P}_{2}=\left(37 \mathrm{x}_{3}+\mathrm{x}_{4}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{P}_{2}=((0)(37)+17)\right)\left(\bmod 37^{2}\right)=17\left(\bmod 37^{2}\right)$
For $\left.\left.\mathrm{i}=4, \mathrm{P}_{3}=\left(37 \mathrm{x}_{5}+\mathrm{x}_{6}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{P}_{3}=((28)(37)+26)\right)\left(\bmod 37^{2}\right)=1062\left(\bmod 37^{2}\right)$
For $\left.\mathrm{i}=6, \mathrm{P}_{1}=\left(37 \mathrm{x}_{7}+\mathrm{x}_{8}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{P}_{4}=((27)(37)+33)\left(\bmod 37^{2}\right)=1032\left(\bmod 37^{2}\right)$
Aftercombine into $2-$ letter segments, $\mathrm{P}_{1}=892, \mathrm{P}_{2}=17, \mathrm{P}_{3}=1062, \mathrm{P}_{4}=1032$
$Q=(\mathrm{P} K+\mathrm{R})\left(\bmod 37^{2}\right)$
$\boldsymbol{Q}=\left(\left(\begin{array}{ll}892 & 17\end{array}\right)\left(\begin{array}{ll}1365 & 5 \\ 1366 & 4\end{array}\right)+\left(\begin{array}{ll}1365 & 5\end{array}\right)\right)\left(\bmod 37^{2}\right)=\left(\begin{array}{ll}484 & 426\end{array}\right)$
$\boldsymbol{Q}=\left(\left(\begin{array}{ll}1062 & 1032\end{array}\right)\left(\begin{array}{ll}1365 & 5 \\ 1366 & 4\end{array}\right)+\left(\begin{array}{ll}1365 & 5\end{array}\right)\right)\left(\bmod 37^{2}\right)=(13541229)$
Split into 2-letter segments $\left.Q_{\frac{i}{2}+1}=\left(y_{i+1} q+y_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6$
For $\left.\left.\mathrm{i}=0, \mathrm{Q}_{1}=484=\left(\mathrm{y}_{1} 37+\mathrm{y}_{2}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{1}=(13(37)+3)\right)\left({\bmod 37^{2}}^{2}\right) \Rightarrow \mathrm{Q}_{1}=(13,3)$
For $\left.\left.i=2, Q_{2}=426=\left(y_{3} 37+y_{4}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow Q_{2}=(11(37)+19)\right)\left(\bmod 37^{2}\right) \Rightarrow Q_{2}=(11,19)$
For $\left.\mathrm{i}=4, \mathrm{Q}_{3}=1354=\left(\mathrm{y}_{5} 37+\mathrm{y}_{6}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{3}=(36(37)+22)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{3}=(36,22)$
For $\left.\mathrm{i}=6, \mathrm{Q}_{4}=1229=\left(\mathrm{y}_{7} 37+\mathrm{y}_{8}\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{4}=(33(37)+8)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{4}=(33,8)$.
$\therefore$ Cipher text $\mathrm{Q}=\left(\mathrm{Q}_{1}, \mathrm{Q}_{2}, \mathrm{Q}_{3}, \mathrm{Q}_{4}\right)=$ '"NDLT W7I"

## Decryption:

combine into 2 - letter segments $\left.\mathrm{Q}_{\frac{i}{2}+1}=\left(\mathrm{y}_{i+1} q+\mathrm{y}_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6$
For $\left.\left.\mathrm{i}=0, \mathrm{Q}_{1}=\left(\mathrm{y}_{1} 37+\mathrm{y}_{2}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{1}=(13(37)+3)\right)\left(\bmod 37^{2}\right)=484\left(\bmod 37^{2}\right)$
For $\left.\left.\mathrm{i}=2, \mathrm{Q}_{2}=\left(\mathrm{y}_{3} 37+\mathrm{y}_{4}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{2}=(11(37)+19)\right)\left(\bmod 37^{2}\right)=426\left(\bmod 37^{2}\right)$
For $\left.\mathrm{i}=4, \mathrm{Q}_{3}=\left(\mathrm{y}_{5} 37+\mathrm{y}_{6}\right)\right)\left(\bmod 37^{2}\right) \Rightarrow \mathrm{Q}_{3}=(36(37)+22)\left(\bmod 37^{2}\right)=1354\left(\bmod 37^{2}\right)$
For $\left.i=6, Q_{4}=\left(y_{7} 37+y_{8}\right)\left(\bmod 37^{2}\right) \Rightarrow Q_{4}=(33(37)+8)\right)\left(\bmod 37^{2}\right)=1229\left(\bmod 37^{2}\right)$
After combine into 2 - letter segments, $Q_{1}=484, Q_{2}=426, Q_{3}=1354, Q_{4}=1229$
$P=(Q-\mathrm{R}) K\left(\bmod 37^{2}\right)$
$\mathrm{P}=\left(\left(\begin{array}{ll}488 & 430\end{array}\right)\left(\begin{array}{ll}1365 & 5 \\ 1366 & 4\end{array}\right)\right)\left(\bmod 37^{2}\right)=\left(\begin{array}{ll}893 & 17\end{array}\right)$
$\mathrm{P}=\left((8701224)\left(\begin{array}{ll}1365 & 5 \\ 1366 & 4\end{array}\right)\right)\left(\bmod 37^{2}\right)=(10621032)$
Split into $2-$ letter segments $\left.\mathrm{P}_{\frac{i}{2}+1}=\left(\mathrm{x}_{i+1} q+\mathrm{x}_{i+2}\right)\right)\left(\bmod q^{2}\right)$ where $\mathrm{i}=0,2,4,6$
For $\mathrm{i}=0, \mathrm{P}_{1}=892 \Rightarrow \mathrm{P}_{1}=((24)(37)+4)\left(\bmod 37^{2}\right) \Rightarrow P_{1}=(24,4)$
For $\left.i=2, P_{2}=17 \Rightarrow P_{2}=((0)(37)+17)\right)\left(\bmod 37^{2}\right) \Rightarrow P_{2}=(0,17)$
For $\left.\mathrm{i}=4, \mathrm{P}_{3}=1062 \Rightarrow \mathrm{P}_{3}=((28)(37)+26)\right)\left(\bmod 37^{2} \Rightarrow P_{3}=(28,26)\right.$
For $\left.i=6, P_{4}=1032 \Rightarrow P_{4}=((27)(37)+33)\right)\left(\bmod 37^{2}\right) \Rightarrow P_{4}=(27,33)$

It gives original plaintext $=$ "YEAR2017"

## 8. Cryptanalysis of known plaintext attack when $m$ is known on Digraph Affine Hill cipher:

The Digraph Affine Hill Cipher, the opponent has to know the values of the size $m$ of the plaintext block size $n$ of the cipher text block and the constant vector $b$ to determine the matrix of the transformation even for a known plaintext attack. Let us assume that the opponent has determined the value of the $m$ being used. Let mbe distinct plaintext-cipher text pairs, say, $\boldsymbol{x} j=\left(x_{1 j}, x_{2 j}, \ldots, x_{m j}\right)$ and $\boldsymbol{y} j=\left(y_{1 j}, y_{2 j}, \ldots, y_{m j}\right), 1 \leq j \leq m$, such that $\boldsymbol{y}_{\mathrm{j}}=e k\left(\boldsymbol{x}_{j}\right)+\mathrm{b}$,Define $m \times m$ matrices $\boldsymbol{P}=\left(x_{i j}\right)$ and $\boldsymbol{Q}=\left(y_{i j}\right)$.Whenever $\boldsymbol{K}$ is invertible in the
encryption equation $\boldsymbol{Q}=\boldsymbol{P} \boldsymbol{K}+\boldsymbol{R}$, one has to choose a different continuous pair of plaintextcipher text pairs.

### 8.1. Example for cryptanalysis when $\mathbf{m}=\mathbf{2}$ is known

Taking from Example 7.1, we get plaintext blocks are $P_{1}=(24,4), P_{2}=(0,17), P_{3}=(28,26), P_{4}=(27,33)$, corresponding cipher text blocks are $Q_{1}=(13,3), Q_{2}=(11,19), Q_{3}=(36,22)$,
$\mathrm{Q}_{4}=(33,8)$.
By using 5.1. Algorithm for known plain-text attack when $m$ is knownthen
$\binom{Q_{1}-Q_{2}}{Q_{2}-Q_{3}}=\binom{P_{1}-P_{2}}{P_{2}-P_{3}} K$

$$
\left(\begin{array}{cc}
2 & 21 \\
12 & 34
\end{array}\right)=K\left(\begin{array}{cc}
24 & 24 \\
9 & 28
\end{array}\right) \Rightarrow K=\left(\begin{array}{cc}
24 & 24 \\
9 & 28
\end{array}\right)^{-1}\left(\begin{array}{cc}
33 & 22 \\
23 & 6
\end{array}\right)(\bmod 37)=\left(\begin{array}{cc}
30 & 18 \\
4 & 6
\end{array}\right)
$$

But In example 7.1 we used the key $K=\left(\begin{array}{ll}1365 & 5 \\ 1366 & 4\end{array}\right)$
So, By using this method we avoid known plain text attack when $m$ is known.

## 9. CONCLUSION

In this proposed system introduce Digraph Affine Hill cipher which is more secure than Affine Hill Cipher.These strategies envelop less computational complexity as inverse of the matrix isnot required while decrypting in Affine Hill Cipher and Digraph Affine Hill cipher.Digraph Affine Hill cipher avoids known plain text attack.
